Simulated Handwriting Software

The **DAMILIC** simulated handwriting program prepares files for “hand-addressed” personalized notes and envelopes produced with Signature Systems’ products (SignatureWare software). The software can be used in conjunction with a Windows-based printer or plotter. It selects characters from a handwriting style instruction set (“font” file) based on **DAMILIC** handwriting styles or the customer’s own handwriting. These letters are then connected together to provide continuous handwritten files. Since the basic font file typically contains several examples of the same character, there is little, if any, obvious repetition of the letters as the program connects varying combinations of letters.

The program accepts text directly typed into the program, or imported from a previously prepared text file or spreadsheet. Formatting options allow changes in paper size and margin dimensions. Writing output and line spacing can be individually scaled.

Please contact **DAMILIC** directly for pricing information on the software and/or the development of your own unique handwriting style table.
